26530 7590 10/13/2010 LADAS & PARRY LLP 224 SOUTH MICHIGAN AVENUE SUITE 1600 CHICAGO, IL 60604			EXAMINER AVERY, JEREMIAH L	
			ART UNIT 2431	PAPER NUMBER
			MAIL DATE 10/13/2010	DELIVERY MODE PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

# Office Action Summary

**Application No.**

10/534,928

**Applicant(s)**

DENG ET AL.

**Examiner**

JEREMIAH AVERY

**Art Unit**

2431

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 21 July 2010.  
2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.  
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1 and 3-13 is/are pending in the application.  
4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.  
5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.  
6) ☒ Claim(s) 1 and 3-13 is/are rejected.  
7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.  
8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.  
10) ☒ The drawing(s) filed on 13 May 2005 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).  
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☒ All b) ☐ Some \* c) ☐ None of:  
1. ☒ Certified copies of the priority documents have been received.  
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)  
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)  
3) ☒ Information Disclosure Statement(s) (PTO/GS-08)  
4) ☐ Interview Summary (PTO-413)  
5) ☐ Notice of Informal Patent Application  
6) ☐ Other: \_\_\_\_\_  
Paper No(s)/Mail Date 06/10/10

**DETAILED ACTION**

- I. Claim 14-21 has been cancelled.
- II. Claims 1 and 3-13 have been examined.
- III. Responses to Applicant's remarks have been given.

***Response to Arguments***

- 1. The Applicant's remarks state that claims 14-21 are cancelled; however the set of claims only indicates that claims 14-20 have been cancelled. Appropriate clarification is requested.
- 2. Regarding the Applicant's arguments pertaining to the storage via "a removable semiconductor memory device", the Examiner, upon further review of the Thomlinson reference, states that Thomlinson's disclosure of "flash memory cards" which "may also be used in the exemplary operating environment" (column 5, lines 1-13) sufficiently discloses said "removable semiconductor memory device". On page 6 of the Applicant's remarks, as well as page 6, lines 24-30 of the Applicant's Specification, it is stated that the "semiconductor memory device can use a flash memory as storage medium to realize the removable storage of massive data based on the universal interface of USB, IEEE 1394, etc.);"; thus the additional disclosure within Thomlinson of, inter alia, "flash memory cards" being utilized for the storage of "computer readable instructions, data structure, program modules and other data" provides disclosure of the Applicant's claimed invention.
- 3. With regards to the Applicant's arguments pertaining to the newly added decryption of the algorithm, the Examiner asserts that Lys discloses this within column

15, lines 1-3, "The decoding process may involve deciphering the pertinent information from the remaining information in the signal". Further, the Applicant states on page 7 of their remarks that "*before* an algorithm is executed, a decryption process is executed by the controller module". However, the claim language within independent claim 1 details the decryption process as occurring *during* execution of the algorithm (i.e. "*when executing an algorithm* stored in the semiconductor storage medium module, the controller module receiving an algorithm invoking parameter from the universal interface, decrypting the algorithm corresponding to the algorithm invoking parameter, executing the decrypted algorithm").

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1 and 3-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over United States Patent No. 6,272,631 to Thomlinson et al., hereinafter Thomlinson, and further in view of United States Patent No. 6,717,376 to Lys et al., hereinafter Lys.

4. Regarding claim 1, Thomlinson teaches a method for realizing data security storage and algorithm storage by means of a removable semiconductor memory device (column 5, lines 1-10, "The drives and their associated computer-readable media provide nonvolatile storage of computer readable instructions, data structures, program modules and other data for the personal computer 20. Although the exemplary environment described herein employs a hard disk, a removable magnetic disk 29 and a removable optical disk 31, it should be appreciated by those skilled in the art that *other types of computer readable media which can store data* that is accessible by a computer, such as magnetic cassettes, *flash memory cards*, digital video disks...may also be used in the exemplary operating environment"), wherein the semiconductor memory device comprises a controller module as well as a universal interface module and a semiconductor storage medium module electrically connected with the controller module, respectively, wherein the semiconductor storage medium module comprises one or more semiconductor chips, characterized in that the method comprises the steps of:

dividing the semiconductor storage medium module into at least two logic memory spaces (column 4, lines 45-55, "system memory includes read only memory (ROM) 24 and random access memory (RAM) 25" and column 7, lines 25-32, "a dynamically linked library (DLL) that can be executed in the application programs' address spaces");

using at least one of the logic memory spaces for storing the data to be protected (column 2, lines 16-23, column 3, lines 7-15, column 6, lines 10-35, "the protected storage system allows application programs to securely store data items that must be kept private and free from tampering", column 7, lines 15-21, "the protected storage system is implemented in a different address space than the calling application programs", column 9, lines 31-43 and column 11, lines 28-35);

setting up and storing a password for the semiconductor memory device and said at least one logic memory space (column 2, lines 37-44, column 6, lines 10-25, column 8, lines 53-58, 66 and 67, column 9, lines 1-6 and 31-58 and column 10, lines 33-38);

certifying the password before read/write operation; when writing the data to be protected in the semiconductor memory device, the controller module receiving the data from the universal interface and, after encrypting the data, storing the encrypted data in the semiconductor storage medium module (column 2, lines 28-44 and 60-67, column 3, lines 1-21, column 4, lines 45-67, column 5, lines 1-18, column 6, lines 10-39 and 47-53, column 7, lines 41-53, column 9, lines 31-37 and 59-63 and column 10, lines 1-14 and 30-50, "the storage server stores the encrypted individual data item, the item authentication code, the encrypted item key, the encrypted item authentication key, the key authentication code, the encrypted master key, and the encrypted master authentication key, to be retrieved later when requested by an authorized application program");

and when reading the data to be protected from the semiconductor memory device, the controller module decrypting the data and transmitting the decrypted data via the

universal interface (column 3, lines 12-15, column 6, lines 47-53 and column 9, lines 31-47 and 59-65).

5. Thomlinson significantly teaches the claimed invention, as cited above.

However, Thomlinson does not sufficiently teach the claim language pertaining to the execution and decryption of an algorithm that has been stored "in the semiconductor storage medium module". Lys teaches said claim language, as cited below.

6. Regarding claim 1, Lys teaches when executing an algorithm stored in the semiconductor storage medium module, the controller module receiving an algorithm invoking a parameter from the universal interface, decrypting the algorithm corresponding to the algorithm invoking parameter, executing the decrypted algorithm, and transmitting a result of the execution via the universal interface, wherein data to be protected comprises an algorithm (column 15, lines 1-3, "The decoding process may involve deciphering the pertinent information from the remaining information in the signal", column 16, lines 6-16 and column 18, lines 36-49).

7. The motivation to combine would be provide a means "to select a program from memory, modify a program from memory, modify a program parameter from memory, select an external signal or provide other user interface solutions." (Lys – column 16, lines 13-16).

8. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teachings of Lys with the teachings of Thomlinson to provide a means to store the appropriate instructions to execute various functions.

9. Regarding claim 3, Thomlinson teaches that the semiconductor storage medium module comprises a storage medium, *or* a combination of at least two storage media (column 2, lines 16-23, column 3, lines 7-15, column 6, lines 10-35, "the protected storage system allows application programs to securely store data items that must be kept private and free from tampering", column 4, lines 45-55, "system memory includes read only memory (ROM) 24 and random access memory (RAM) 25", column 7, lines 15-32, "the protected storage system is implemented in a different address space than the calling application programs" and "a dynamically linked library (DLL) that can be executed in the application programs' address spaces", column 9, lines 31-43 and column 11, lines 28-35).

10. Regarding claim 4, Thomlinson teaches that the semiconductor memory device and said at least one logic memory space set up at least two levels of users passwords (column 7, lines 64-67, column 8, lines 1-29 and 41-57 and column 9, lines 1-6 and 31-49).

11. Regarding claim 5, Thomlinson teaches that certification of user passwords is implemented before operation in all logic memory spaces, *or* before operation in the logic memory spaces storing the data to be protected (column 8, lines 53-67 and column 9, lines 1-11 and 31-58, "wherein data items are encrypted based on a user-supplied password, or some other code related to user authentication, before storing the data items").

12. Regarding claim 6, Thomlinson teaches setting up a database, and conducting access and authority management to the data to be protected by way of the database (column 3, lines 7-15, column 6, lines 10-29 and 40-53 and column 7, lines 15-32).

13. Regarding claim 7, Thomlinson teaches that the authority comprises reading authority, writing authority, modifying authority, deleting authority and executing authority, each authority having the meanings of:

Reading authority: only allowing reading record data in the database; Writing authority: only allowing writing new data in the database, but not covering the record data with the same record title (column 8, lines 1-9, "read and write access");

Modifying authority: only allowing writing data in the database and covering the record data with the same record title (column 8, lines 46-52, "the user can later modify access rights to the data");

Deleting authority: allowing deleting the database or records therein (column 27, part of the IPStore Interface, "DeleteItem", "DeleteSubtype" and "DeleteType");

Executing authority: allowing executing record codes in the database, which is an authority with respect to a self-defined algorithm or function code and it is invalid to designate an executing authority for normal record data (column 8, lines 53-67 and column 9, lines 1-11 and 31-58, "wherein data items are encrypted based on a user-supplied password, or some other code related to user authentication, before storing the data items").

14. Regarding claim 8, Thomlinson teaches that at least one of the logic memory spaces is used for storing data that does not need protection (column 4, lines 45-67 and column 5, lines 1-20).

15. Regarding claim 9, Thomlinson teaches in that an anti-falsifying identification is performed to identify whether the transmitted or stored data is falsified or not (column 9, lines 20-28 and column 11, lines 4-10).

16. Regarding claim 10, Thomlinson teaches that during transmitting or storing data, *the anti-falsifying identification* comprises the steps of:

A. invoking an encrypting algorithm to convert original data to obtain a conversion value X (column 2, lines 28-44 and 60-67, column 3, lines 1-21, column 4, lines 45-67, column 5, lines 1-18, column 6, lines 10-39 and 47-53, column 7, lines 41-53, column 9, lines 31-37 and 59-63 and column 10, lines 1-14 and 30-50);

B. packing the original data and the conversion value X according to a format to form a data package (column 3, lines 7-15, column 6, lines 10-29 and 40-53 and column 7, lines 15-32);

C. transmitting or storing the data package (column 2, lines 16-23, column 3, lines 7-15, column 6, lines 10-35, "the protected storage system allows application programs to securely store data items that must be kept private and free from tampering", column 4, lines 45-55, "system memory includes read only memory (ROM) 24 and random access memory (RAM) 25", column 7, lines 15-32, "the protected storage system is implemented in a different address space than the calling application programs" and "a

dynamically linked library (DLL) that can be executed in the application programs' address spaces", column 9, lines 31-43 and column 11, lines 28-35); and during receiving or reading data, the anti-falsifying identification comprises the steps of:

A. unpacking the data package according to the format to obtain the unpacked original data and the conversion value X (column 3, lines 12-15, column 6, lines 47-53 and column 9, lines 31-47 and 59-65);

B. invoking the encrypting algorithm to calculate a conversion value of the unpacked original data to obtain a conversion value Y (column 2, lines 28-44 and 60-67, column 3, lines 1-21, column 4, lines 45-67, column 5, lines 1-18, column 6, lines 10-39 and 47-53, column 7, lines 41-53, column 9, lines 31-37 and 59-63 and column 10, lines 1-14 and 30-50);

C. comparing the calculated conversion value Y and the conversion value X to see whether they are equal to each other (column 10, lines 46-57, column 11, lines 4-31 and column 12, lines 6-12);

D. if the compared result is that Y and X are equal, indicating the data that has not been falsified, and otherwise indicating that the data has been falsified (column 10, lines 46-57, column 11, lines 4-31 and column 12, lines 6-12).

17. Regarding claim 11, Thomlinson teaches using randomly changeable session key to encrypt the data during the data transmission (column 9, lines 66 and 67, column 10, lines 1-14 and 22-38).

18. Regarding claim 12, Thomlinson teaches that the step of using randomly changeable session key to encrypt data comprises the steps of:

A. at the beginning of the data transmission, transmission end transmitting a request of exchanging session key and introducing at least one random number (column 9, lines 66 and 67, column 10, lines 1-14 and 22-38);

B. after receiving the exchanging session key request, the semiconductor memory device randomly creating at least one random number, converting the received random number and the created random number by a key generating algorithm to produce a session key, and then returning the random number created by the semiconductor memory device to the transmission end (column 9, lines 66 and 67, column 10, lines 1-14 and 22-38);

C. after the transmission end receives the returned random number, converting the returned random number and the random number introduced by the transmission end itself with the key generating algorithm to produce the session key (column 9, lines 66 and 67, column 10, lines 1-14 and 22-38).

19. Regarding claim 13, Thomlinson teaches that the data to be protected include documents, passwords, cipher keys, account numbers, digital certificates, encrypting algorithm, self-defined algorithm, user information and user self-defined data (column 2, lines 28-44 and 60-67, column 3, lines 1-21, column 4, lines 45-67, column 5, lines 1-18, column 6, lines 10-39 and 47-53, column 7, lines 41-53 and 64-67, column 8, lines 1-29 and 41-57, column 9, lines 1-6, 31-37 and 59-63 and column 10, lines 1-14 and 30-50, "the storage server stores the encrypted individual data item, the item authentication

code, the encrypted item key, the encrypted item authentication key, the key authentication code, the encrypted master key, and the encrypted master authentication key, to be retrieved later when requested by an authorized application program").

***Conclusion***

20. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).
21. A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.
22. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
23. The following United States Patents are cited to further show the state of the art with respect to secure data protection, such as:

United States Patent No. 7,047,416 to Wheeler et al., which is cited to show an account-based digital signature (ABDS) system.

United States Patent No. 5,864,683 to Boebert et al., which is cited to show a system for providing secure internetwork by connecting type

enforcing secure computers to external network for limiting access to data based on user and process access rights.

United States Patent No. 6,832,317 to Strongin et al., which is cited to show a personal computer security mechanism.

United States Patent No. 7,065,654 to Gulick et al., which is cited to show a secure execution box.

United States Patent No. 6,934,836 to Strand et al., which is cited to show a fluid separation conduit cartridge with encryption capability.

United States Patent No. 6,757,832 to Silverbrook et al., which is cited to show unauthorized modification of values in flash memory.

United States Patent No. 6,816,968 to Walmsley, which is cited to show a consumable authentication protocol and system.

United States Patent No. 6,721,891 to Borza, which is cited to show a method of distributing piracy protected computer software.

United States Patent No. 6,698,654 to Zuppichich which is cited to show a method of interfacing with data storage card.

United States Patent No. 7,194,768 to Kisliakov, which is cited to show access control for a microprocessor card.

United States Patent No. 6,550,011 to Sims, which is cited to show media content protection utilizing public key cryptography.

24. Any inquiry concerning this communication or earlier communications from the examiner should be directed to JEREMIAH AVERY whose telephone number is

(571)272-8627. The examiner can normally be reached on Monday thru Friday 8:30am-5pm.

25. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, William Korzuch can be reached on (571) 272-7589. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

26. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
